

CATTLE TURNIP

GREEN GLOBE

THE MULTI-PURPOSE PERFORMER

SUMMER CROP - Green Globe turnip can be used as a summer feed option with all livestock. On dairy farms, turnips fill the feed gap and maximise milk production. When Green Globe is utilised in conjunction with an earlier maturing turnip variety, it results in an extended grazing period of between 60-120 days. This is because the earlier variety can be grazed from 60 to 90 days and the Green Globe from 90-120 days.

Using this system, farmers don't have to worry about the quality of their turnip crop declining because they are trying to maintain an early maturing cultivar for too long, and they don't need to worry about reduced yields by having to graze a later maturing crop too early. Green Globe and an earlier maturing turnip may complement each other very well.

LATE AUTUMN/WINTER FEED - Green Globe turnips are ideal for late autumn/winter feed in more challenging environments. Planted in summer they can be grazed 90-120 days after sowing, they do not require a specific ripening period.

OVERVIEW

Sowing Rate: 2 kg/ha

Days to Grazing: From 90 to 120 days

Growing Seasons: Spring, Summer

Grazing Seasons: Summer, Autumn

Potential Yield: 10,000 kgDM/ha

Utilisation: 80%

- Multi-purpose product can be sown for grazing in summer, autumn and winter
- Proven winter hardiness
- Good yield potential (10000 kgDM/ha)
- Late Summer/Autumn maturing
- High producer turnip in Winter.
- Can be used as a Summer turnip.
- Excellent feed option as keeping quality.
- Grazing from: 90-120 days.
- Firm white flesh and green skinned.
