

AUTUMN GRAZER

50% STOOLING RYE
50% TRITICALE

MORE WINTER FEED

Our new AUTUMN GRAZER blend offers more winter feed, while still providing great quality. Where irrigation is not possible, by combining the quick winter feed production of TRITICALE and the longevity of STOOLING RYE it results in an excellent blend of both.

TRITICALE is a medium season, tall, high tillering variety with a reduced awn head type which may be grown for forage or grain. TRITICALE has good resistance to all rusts and CCN.

STOOLING RYE is adapted for extremely cold temperatures and drought conditions and maintains a quality feed for longer. The AUTUMN GRAZER blend can be sown from February in cooler areas and in March in warmer areas.

The sowing rates will vary depending on the rainfall, but on average under dryland conditions, AUTUMN GRAZER can be sown at 50kg/ha and under more favorable or irrigated conditions one can establish at 75 - 100kg/ha.

- Quick winter feed
- Winter feed for a longer period
- Dryland sow at 50kg/ha
- Irrigated sow at 75 - 100kg/ha
- Best of both worlds
