

BARLEY

CAP7302

OVERVIEW

With a yield 10% higher than other varieties in late plantings, CAP7302 stands out for its high yield potential and its short cycle. It has a very good resistance to the diseases *Drechlera teres* and *Rhynchosporium secalis* and is moderately susceptible to leaf rust (*Puccinia Hordei*).

It is one of the quickest cultivar on the market, which allows for later plantings and / or harvests up to a week earlier, favoring a second crop. It has excellent performance stability and grain quality. Its grain has a high hectoliter mass. It adapts to all regions of the country. The sowing date is similar to that of a short-cycle wheat.

- Higher yield when late planting
- Good behaviour to disease
- Medium to high hectoliter weight
- Good adaption to all regions
