

TALL FESCUE

BOSCHHOEK

SOFT LEAFED FOR QUALITY WINTER PRODUCTION

BOSCHHOEK is ideally suited for South African conditions. Whereas most Fescues have fairly coarse leaves, resulting in lower palatability, Boschhoek, with its relatively soft leaves, is more acceptable to the grazing animal and therefore of wider use. It is also useful for sowing in heavy bottom-land soils as a permanent pasture. BOSCHHOEK can be grown under irrigation or where the annual rainfall exceeds about 900mm and summer temperatures are not too high.

BOSCHHOEK has high dry matter production and is bred in S.A. for S.A conditions using dairy cows to select palatable plants. It is a tufted perennial with dense tillers and is used for grazing, silage and hay. It should be held over early autumn for good growth and is a variety that is protected by Plant Breeders Rights.

- Good rust resistance
- Forage production peaks in late spring/early summer and in autumn
- Quality winter forage (standing hay)
