

WESTERWOLD RYEGRASS

MELJUMP (Tetraploid)

PERFECT ALL-ROUNDER

MELJUMP is a tetraploid Westerwold annual ryegrass (*Lolium multiflorum*) renowned for its exceptional yield performance, and rust resistance. MELJUMP has been bred for its stability and vigour and offers fast establishment, excellent early growth, and consistent regrowth, making it a reliable choice for forage producers.

MELJUMP achieves high yield in the first cut or grazing but really proves itself in the aftermath! MELJUMP is ideal for early forage production and is well suited with high seasonal yield potential. It can serve as a nurse crop during the establishment of permanent or perennial pastures.

MELJUMP performs best in temperate and subtropical climates but is adaptable to a wide range of conditions.

MELJUMP prefers fertile and well-drained soils, while adapting to most other soil types.

MELJUMP can be sown under irrigation and under dry land conditions where the average rainfall is in excess of 850mm.

- High Yield Potential
- High Stability
- Good Rust Resistance
- Rapid Establishment
- Adapability to versatile conditions
